

Assignment 03 - Reflection

From the beginning, the robot did not seem to be making any mistakes. While starting off the exercise with small numbers like 2,3,4,5, all the results ended up being correct. Mistakes and errors started to appear when I put the number 7 into it, and it actually kept on making mistakes with the number 7, to the point that I continued to test on other numbers, but the answers were right until I re-introduced the number 7. And also, the mistakes were made during the last stages of the multiplications once the numbers were becoming too large. Steps 1 to 3 were easily completed, while Step 4 brought about the problem.

In the end, I got to see that because the AI used is more of a language type of bot, it cannot be very reliable for calculations, compared to smart calculators. As it was previously stated, GPT predicts the most likely continuation of the text and does not do the actual calculation at hand. Multiplications of small numbers are common and would say "easier to compute" whereas multiplications of huge numbers become much more complex for the robot because they are not as common. The numbers were always increasing in size and so this brought the mistakes.

The "personality" part of the exercise made the interaction much more interesting and entertaining. Clearly, the AI stayed within the "frustrated" emotion whenever it would get the wrong answers, but it would repeat itself a lot, since the bot ended up choosing from a very limited list of phrases given to it, in order to react. At the same time, it was also interesting how it would be consistent in its "personality" by also reacting whenever it would get a good answer. In the future, it would be possible to instruct it to create a new joke each time depending on the number of errors that it had made.
